

Monoliths to microservices: App Transformation

Hands-on Technical Workshop

Part 3: Monoliths to microservices with MicroProfile & Spring Boot

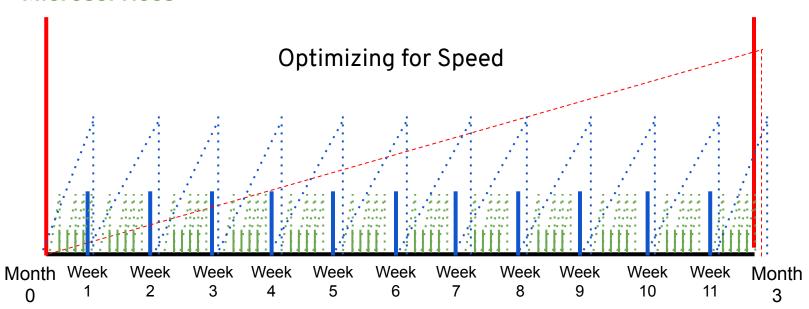

Why monolith to microservices

Break things down (organizations, teams, IT systems, etc) down into smaller pieces for greater parallelization and autonomy and focus on reducing time to value.

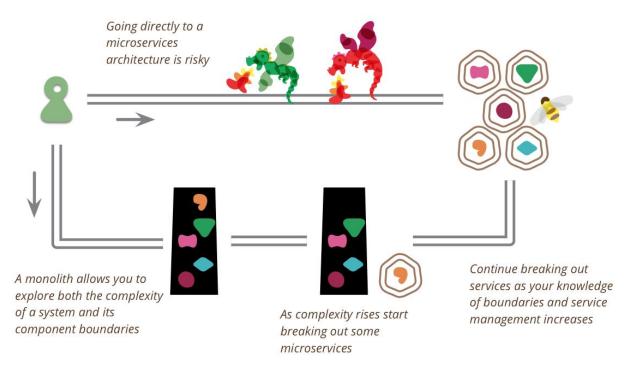

Reducing time to value

Monolith Lifecycle
Fast Moving Monolith
Microservices

Monolith first?

http://martinfowler.com/bliki/MonolithFirst.html

The bigger picture: the path to cloud-native apps

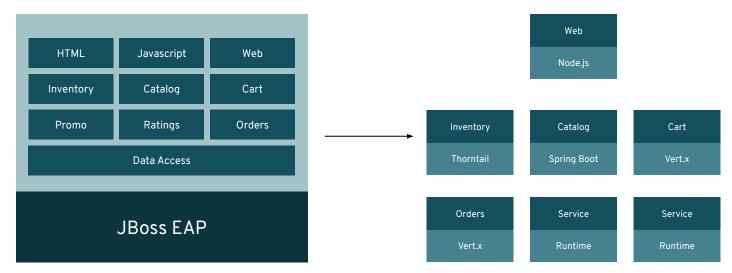

A DIGITAL DARWINISM

Strangling the monolith

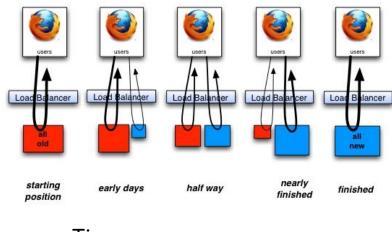

- In this lab, you will begin to 'strangle' the coolstore monolith by implementing its services as external microservices, split along business boundaries
- Once implemented, traffic destined to the original monolith's services will be redirected (via OpenShift software-defined routing) to the new services

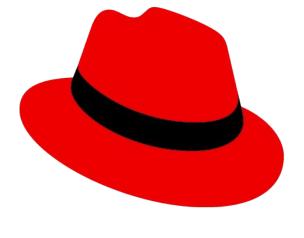

Strangling the monolith

- Strangling incrementally replacing functionality in app with something better (cheaper, faster, easier to maintain).
- As functionality is replaced, "dead" parts of monolith can be removed/retired.
- You can also wait for all functionality to be replaced before retiring anything!
- You can optionally include new functionality during strangulation to make it more attractive to business stakeholders.

Time _____

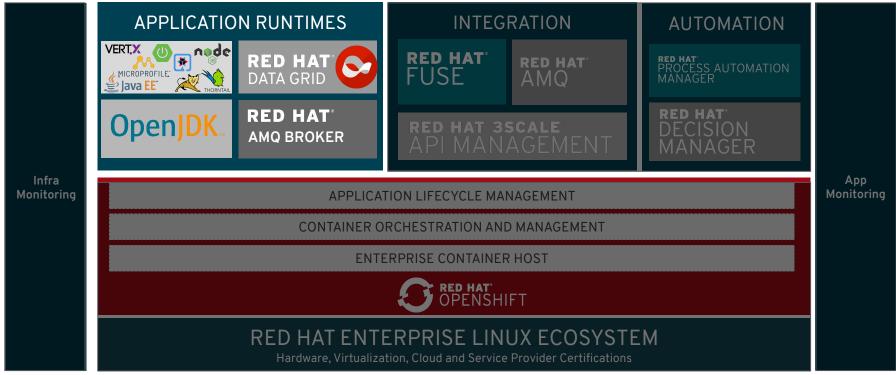

Red Hat Runtines

Red Hat platform for the hybrid cloud

OpenShift and Middleware optimized for the cloud

Red Hat Runtimes

Non-restrictive development for the hybrid cloud

JAVA SE OPENJDK	JAVA EE JBOSS EAP/OPEN LIBERTY*	JAVA WEB JBOSS WS	DISTRIBUTED DATA DATA GRID				
SERVERLESS CLOUD FUNCTIONS*	SPRING SPRING BOOT	JAVASCRIPT NODE.JS					
SUPERSONIC SUBATOMIC JAVA QUARKUS*	MICROPROFILE THORNTAIL	REACTIVE VERT.X	MESSAGING AMQ BROKER				
SECURITY RED HAT'SSO							

Facilitate cloud native app development ON THE HYBRID CLOUD:

- ✓ Faster getting started
- ✓ Simplify container dev
- ✓ Automate DevOps
- ✓ Standardize tools/processes
- ✓ Fully supported JDK

LAUNCH SERVICE

Optimized for OpenShift / Kubernetes Services with pre-configured Missions and Boosters Integration with RH Developer, CI/CD tools, Security Services

Available Application Migration Toolkit

Python, Go and .Net also supported by Red Hat (with a different SLA)

Spring

- Microservices for Developers using Spring Framework
- An opinionated approach to building Spring applications
- Historical alternative to Java EE
- Getting started experience
- Spring MVC / DI / Boot most popular

Spring in Red Hat Runtimes

- It's the same Spring you know and love
- Tested and Verified by Red Hat QE
 - Spring Boot, Spring Cloud Kubernetes, Ribbon, Hystrix
- Red Hat components fully supported
 - Tomcat, Hibernate, CXF, SSO (Keycloak), Messaging (AMQ), ...
- Native Kubernetes/OpenShift integration (Spring Cloud)
 - Service Discovery via k8s (DNS), Ribbon
 - Spring Config via ConfigMap
- Developer Tooling (launch.openshift.io, starters)
- Additional planned support for
 - Transactions (Narayana), Messaging (Rabbit MQ -> AMQ), more

Cloud native support in Spring

- Health Checks (actuator)
- Externalized Config (spring-cloud-kubernetes)
- Client-side discovery / load balancing (Eureka/Kubernetes)
- Circuit Breaking / Bulkheading (Hystrix)
- Logging / Monitoring / Tracing / Metrics
- Secure deployments with Keycloak
- API Documentation (Swagger)

Thorntail

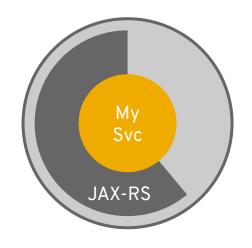

THORNTAIL

Java EE microservices

- Leverage Java EE expertise
- Open standard
- Microservices focus
- Optimized for OpenShift
- Super lightweight
- **Tooling for Developers**

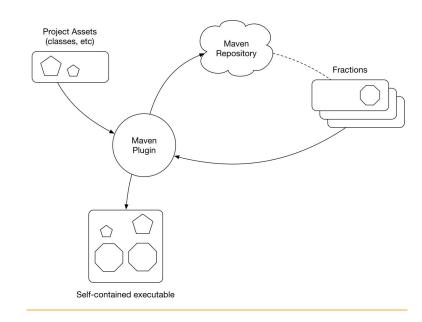

\$ java -jar my microservice.jar

Thorntail "pieces" - Fractions

- A tangible unit providing a specific piece of functionality
- Embodied in a mayen artifact
- To support the compositional aspect in Thorntail
- Provides the "runtime" capabilities
- Means to add API dependencies (e.g. JAX-RS)
- Means to configure the system
 - With reasonable defaults
- Means to discover other components (topology)
- Means to alter deployments (e.g. keycloak)
- Can be auto-detected or explicitly declared

Cloud native support in Thorntail

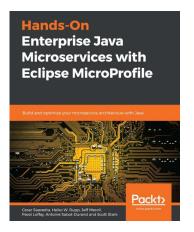

- Health Checks
- Externalized Config
- Client-side discovery / load balancing
- Circuit Breaking / Bulkheading
- Logging / Monitoring / Tracing / Metrics
- Secure deployments with Keycloak
- MicroProfile
- API Documentation

- Defines open source Java microservices specifications
- Industry Collaboration Red Hat, IBM, Payara, Tomitribe, London Java Community, SouJava, Oracle, Hazelcast, Fujitsu, Microsoft...
- Thorntail is Red Hat's implementation
- Minimum footprint for Enterprise Java cloud-native services (v3.2):

JSON-P 1.1	JSON-B 1.0	Health 2.1	JWT Propagation 1.1	Config 1.3	OpenAPI 1.1
CDI 2.0	JAX-RS 2.1	Fault Tolerance 2.0	Metrics 2.2	Open Tracing 1.3	Rest Client 1.3

Lab: Monoliths to microservices with MicroProfile & Spring Boot

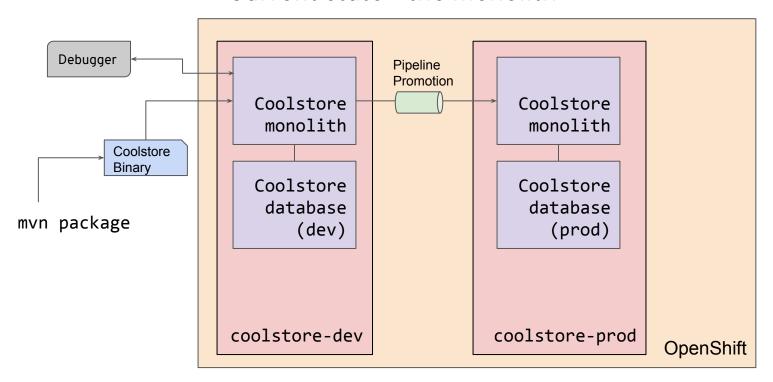

Goal for lab

In this lab you will learn:

- How Red Hat OpenShift and Red Hat Runtimes help jumpstart app modernization
- Benefits and challenges of microservices
- How to transform existing monolithic applications to microservices using <u>strangler pattern</u> and <u>12-factor app</u> patterns.
- Use modern app dev frameworks like <u>Thorntail</u> and <u>Spring</u>
 <u>Boot</u> to implement microservice applications on OpenShift

Current state - the monolith

LAB: MONOLITHS TO MICROSERVICES WITH JAVA EE AND SPRING BOOT

WEB: bit.ly/RH-MS-ARO-lab-guides SLIDES (PDF): bit.ly/RH-MS-ARO-lab-slides

SCENARIO 3A TRANSFORMING AN EXISTING MONOLITH (PART 1)

SCENARIO 3B

TRANSFORMING AN EXISTING MONOLITH (PART 2)

Wrap-up and discussion

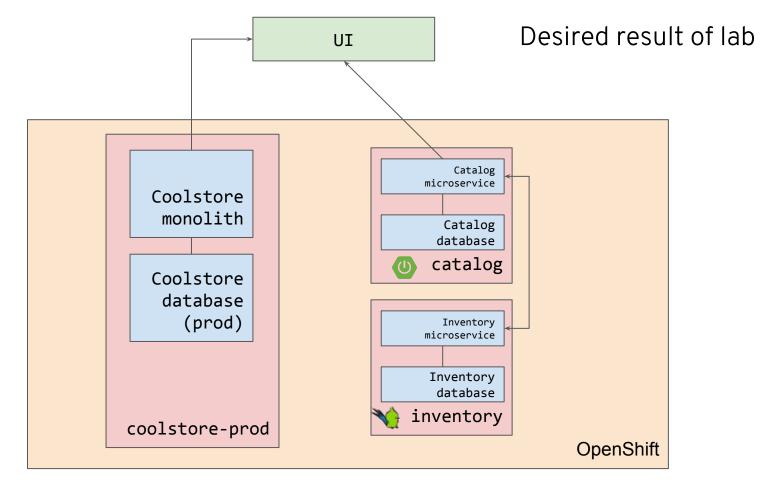

Result of lab

In this lab you learned how to:

- Implement a Java EE microservice using Thorntail
- Implement a Java EE microservice using Spring Boot
- Develop container-based testing
- Add microservice concerns like Health checks, externalized configuration and circuit breaking
- Use the strangler pattern to slowly migrate functionality from monolith to microservices
